Introduction

This document is a section of the Loader Guide. It was formerly the LexEVS v5.0 *Loader Mapping Guide*.

For the LexEVS v5.1 enhancements to the RRF loader, see the Loader Source Mapping section.

OWL Mapping - 4.2.1

OWL: RDF Schema Features

OWL Mapping - Protégé (4.2.1)

OWL Element	LexGrid	Comments
OWL: RDF Schema Features		
owl:ontology	codingScheme	
xml:lang	codingScheme.defaultLanguage	Default is 'en'
dc:title	codingScheme.formalName	
rdfs:label	codingScheme.localName	
URI	codingScheme.registeredName	
owl:versionInfo	codingScheme.representsVersion	Default is 'UNASSIGNED'
dc:rights	codingScheme.copyright	
owl:Class (Thing, Nothing)	concept	
rdf:ID	concept.conceptCode	
	concept.isActive	Hard coded as "Active"
	concept.isAnonymous	
rsfs:label	concept.entityDescription	
rdf:comment	concept.comment	
rdfs:subClassOf	association	
	association.id = "subClassOf"	
	association.forwardName = "subClassOf"	
	association.isFunctional = "false"	
	association.isNavigable = "true"	
	association.isReflexive="true"	
	association.isSymmetric="false"	
	association.isTransitive="true"	
rdf:Property (ObjectProperty)	association	An association between two classes (hasDomain, hasRange)
	association	An association between one class (domain) and one association (hasDomain and hasDataProperty). The conceptProperty defines the range.
	concept.conceptProperty	
rdfs:subPropertyOf	association	
	association.id = "subPropertyOf"	
	association.forwardName = "subPropertyOf"	
	association.isFunctional = "false"	
	association.isNavigable = "true"	
	association.isReflexive="true"	
	association.isSymmetric="false"	
	association.isTransitive="true"	
rdfs:domain	association	
	association.id = "hasDomain"	
	association.forwardName = "hasDomain"	
	association.isNavigable = "true"	
	association.isReflexive="false"	
	association.isSymmetric="false"	
	association.isTransitive="true"	
rdfs:range	association	
	association.id = "hasRange"	
	association.forwardName = "hasRange"	
	association.isNavigable = "true"	
	association.isReflexive="false"	
	association.isSymmetric="false"	
	association.isTransitive="false"	
Individual	association	A 'hasInstance' association is created. (ie. sourceId = Country, targetId = America)
	association.id = "hasInstance"	

OWL: (In)Equality

OWL Mapping - Protégé (4.2.1)		
OWL Element	LexGrid	Comments
OWL: (In)Equality		
owl:equivalentClass	association	
	association.id = "equivalentClass"

	association.id = "equivalentProperty"	
	association.forwardName = "equivalentProperty"	
	association.isFunctional = "false"	
	association.isNavigable = "true"	
	association.isReflexive="true"	
	association.isSymmetric="true"	
	association.isTransitive="true"	
	association.reverseName="equivalentProperty"	
owl:sameAs	association	
	association.id = "sameAs"	
	association.forwardName = "sameAs"	
	association.isFunctional = "false"	
	association.isNavigable = "true"	
	association.isReflexive="true"	
	association.isSymmetric="true"	
	association.isTransitive="true"	
	association.reverseName="sameAs"	
differentFrom	association	
	association.id = "differentFrom"	
	association.forwardName = "differentFrom"	
	association.isFunctional = "false"	
	association.isNavigable = "true"	
	association.isReflexive="true"	
	association.isSymmetric="true"	
	association.isTransitive="true"	
	association.reverseName= "differentFrom"	
owl:AllDifferent	association	
	association.id = "AllDifferent"	
	association.forwardName = "AllDifferent"	
	association.isFunctional = "false"	
	association.isNavigable = "true"	
	association.isReflexive="true"	
	association.isSymmetric="true"	
	association.isTransitive="true"	
	association.reverseName= "AllDifferent"	

OWL: Property Characteristics

OWL Mapping - Protégé (4.2.1)		
OWL Element	LexGrid	Comments
OWL: Property Characteristics		
owl:inverseOf	association	
	association.id = "inverseOf"	
	association.forwardName = "inverseOf"	
	association.isFunctional = "false"	
	association.isNavigable = "true"	
	association.isReflexive="true"	
	association.isSymmetric="true"	
	association.isTransitive="true"	
	association.reverseName="inverseOf"	
owl:TransitiveProperty	association.isTransitive	association property 'isTransitive'
owl:SymmetricProperty	association.isSymmetric	association property 'isSymmetric'
owl:InverseFunctionalProperty	association.isReverseFunctional	association property 'isReverseFunctional'
owl:FunctionalProperty	association.isFunctional	association property 'isFunctional'

OWL: Property Restrictions

OWL Mapping - Protégé (4.2.1)		
OWL Element	LexGrid	Comments
OWL: Property Restrictions		

owl:Restriction	concept	Create an anonymous concept for the restriction
	concept.id	System generated
	concept.isActive = true	
	concept.isAnonymous = true	Hardcoded "True"
owl:onProperty	association.id	
owl:allValuesFrom	concept.entityDescription	String of allValuesFrom values
	concept.presentation.propertyId	Generated value for property textual presentation using "P" concatenated with a steadily incremented numerical value.
	concept.presentation.propertyName	Hardcoded "textualPresentation"
	concept.presentation.isPreferred = true	Hardcoded "true"
	concept.presentation.text	String of allValuesFrom values
	concept.conceptProperty.propertyId	Generated value for property using "P" concatenated with a steadily incremented numerical value.
	concept.conceptProperty.propertyName = type	Hardcoded "type"
	concept.conceptProperty.text = "owl:unionOf"	
owl:someValuesFrom	concept.entityDescription	String of someValuesFrom values
	concept.presentation.propertyId	Generated value for property textual presentation using "P" concatenated with a steadily incremented numerical value.
	concept.presentation.propertyName	Hardcoded "textualPresentation"
	concept.presentation.isPreferred = true	Hardcoded "true"
	concept.presentation.text	String of someValuesFrom values
	concept.conceptProperty.propertyId	Generated value for property using "P" concatenated with a steadily incremented numerical value.
	concept.conceptProperty.propertyName = type	Hardcoded "type"
	concept.conceptProperty.text = "owl:intersectionOf"	
owl:intersectionOf	concept.entityDescription	String of intersectionOf values (ie. Pizza and not VegetarianPizza)
	concept.presentation.propertyId	Generated value for property textual presentation using "P" concatenated with a steadily incremented numerical value.
	concept.presentation.propertyName	Hardcoded "textualPresentation"
	concept.presentation.isPreferred = true	Hardcoded "true"
	concept.presentation.text	String of intersectionOf values (ie. Pizza and not VegetarianPizza)
	concept.conceptProperty.propertyId	Generated value for property using "P" concatenated with a steadily incremented numerical value.
	concept.conceptProperty.propertyName = type	Hardcoded "type"
	concept.conceptProperty.text = "owl:intersectionOf"	
UnionOf	concept.conceptProperty.text = "owl:unionOf"	
owl:complementOf	association	association.id = "subclassOf"
owl:oneOf	concept.entityDescription	String of oneOf values
	concept.presentation.propertyId	Generated value for property textual presentation using "P" concatenated with a steadily incremented numerical value.
	concept.presentation.propertyName	Hardcoded "textualPresentation"
	concept.presentation.isPreferred = true	Hardcoded "true"
	concept.presentation.text	String of oneOf values
	concept.conceptProperty.propertyId	Generated value for property using "P" concatenated with a steadily incremented numerical value.
	concept.conceptProperty.propertyName = type	Hardcoded "type"
	concept.conceptProperty.text = "owl:intersectionOf"	
owl:hasValue	associationQualification.nameAndValueList.content	
owl:minCardinality	concept.entityDescription	String of minCardinality Values (ie. (hasTopping min 3) and Pizza)
	concept.presentation.propertyId	Generated value for property textual presentation using "P" concatenated with a steadily incremented numerical value.
	concept.presentation.propertyName	Hardcoded "textualPresentation"
	concept.presentation.isPreferred = true	Hardcoded "true"
	concept.presentation.text	String of minCardinality Value (ie. (hasTopping min 3) and Pizza)
	concept.conceptProperty.propertyId	Generated value for property using "P" concatenated with a steadily incremented numerical value.
	concept.conceptProperty.propertyName = type	Hardcoded "type"
	concept.conceptProperty.text = "owl:intersectionOf"	
owl:maxCardinality	concept.entityDescription	String of maxCardinality Values (ie. (hasTopping max 2) and Pizza)
	concept.presentation.propertyId	Generated value for property textual presentation using "P" concatenated with a steadily incremented numerical value.
	concept.presentation.propertyName	Hardcoded "textualPresentation"
	concept.presentation.isPreferred = true	Hardcoded "true"
	concept.presentation.text	String of maxCardinality Values (ie. (hasTopping max 2) and Pizza)
		Generated value for property using "P" concatenated with a steadily incremented

	concept.conceptProperty.propertyId	numerical value.
	concept.conceptProperty.propertyName = type	Hardcoded "type"
	concept.conceptProperty.text = "owl:intersectionOf"	
		String of cardinality Values
owl:cardinality	concept.entityDescription	
	concept.presentation.propertyId	Generated value for property textual presentation using "P" concatenated with a steadily incremented numerical value.
	concept.presentation.propertyName	Hardcoded "textualPresentation"
	concept.presentation.isPreferred = true	Hardcoded "true"
	concept.presentation.text	String of cardinality Values
	concept.conceptProperty.propertyId	Generated value for property using "P" concatenated with a steadily incremented numerical value.
	concept.conceptProperty.propertyName = type	Hardcoded "type"
	concept.conceptProperty.text = "owl:intersectionOf"	
owl:disjointWith	association	association.id = "disjointWith"

OWL: Annotation Property

OWL Mapping - Protégé (4.2.1)		
OWL Element	LexGrid	Comments
OWL: Annotation Property		
rdfs:label	Presentation	
	concept.presentation.propertyId	Generated value for property textual presentation using "P" concatenated with a steadily incremented numerical value.
	concept.presentation.propertyName = "textualPresentation"	Hardcoded "textualPresentation"
	concept.presentation.isPreferred = true	Hardcoded "true"
	concept.presentation.text	Value of rdfs:label
rdfs:comment	Comment	
	concept.comment.propertyId	Generated value for property textual presentation using "P" concatenated with a steadily incremented numerical value.
	concept.comment.propertyName = "comment"	Hardcoded "comment"
	concept.presentation.text	Value of rdfs:comment
rdfs:seeAlso	conceptProperty	
rdfs:isDefinedBy	conceptProperty	

OWL: Versioning

				concept.conceptProperty.format	Hard coded as constant in java file as "text/plain"
MRCONSO.RRF	LAT	Language of Term(s)		concept.conceptProperty.language	Logic of code simply selects the first definition in the source as the preferred source
MRCONSO.RRF	TS	Term status		concept.presentation.isPreferred	One or a combination of these RRF values determines whether a presentation is preferred: LAT, TS, STT, ISPREF, RANK.
MRCONSO.RRF	STT	String type		concept.presentation.isPreferred	One or a combination of these RRF values determines whether a presentation is preferred: LAT, TS, STT, ISPREF, RANK.
MRCONSO.RRF	ISPREF	Indicates whether AUI is preferred		concept.presentation.isPreferred	One or a combination of these RRF values determines whether a presentation is preferred: LAT, TS, STT, ISPREF, RANK.
MRRANK.RRF	RANK	Termgroup ranking		concept.presentation.isPreferred	One or a combination of these RRF values determines whether a presentation is preferred: LAT, TS, STT, ISPREF, RANK.
				concept.presentation.isPreferred	The first presentation for each language is automatically marked as isPreferred="true" after using comparator to sort list of presentations using comparator to evaluate each presentation based on a combination of values from LAT, TS, STT, ISPREF, RANK.
MRDEF.RRF	DEF	Definition		concept.definition.text.content	
				concept.definition.isPreferred	Logic of code simply selects the first definition in the source as the preferred source
MRSAT.RRF	ATN	Attribute name		concept.conceptProperty.propertyType	Translated to a LexGrid property type. For values AN, CX, HN this property is typed as a "COMMENT" in LexGrid. For value EV this property is typed "PRESENTATION" This only occurs when the STYPE points to the CODE, SCUI or SDUI columns in MRREL.RRF or MRCONSO.RRF. If the STYPE points to SAUI then the values are loaded as property qualifiers.

MRSAT.RRF	ATV	Attribute value		concept.conceptProperty.propertyValue	
MRSAT.RRF	ATN	Attribute name		concept.conceptProperty.propertyQualifier.propertyQualifierId	If the STYPE points to SAUI then the value is loaded as a property qualifier attribute
MRSAT.RRF	ATV	Attribute value		concept.conceptProperty.propertyQualifier.content	If the STYPE points to SAUI then the value is loaded as a property qualifier attribute
MRCONSO.RRF	SAB		x	concept.conceptProperty.source.content	
			x	concept.conceptProperty.propertyQualifier.propertyQualifierId	hard coded as constant in java file as "source-code"
MRCONSO.RRF	CODE		x	concept.conceptProperty.propertyQualifier.content	
			x	concept.conceptProperty.propertyQualifier.propertyQualifierId	hard coded as constant in java file as "AUI"
MRCONSO.RRF	AUI		x	concept.conceptProperty.propertyQualifier.content	
				concept.presentation.representationalForm	When ATN value is EV this presentation will be given a representationalForm of "Abbrev."
MRCONSO.RRF	TTY	Term type in source		concept.presentation.representationForm	When TTY value is FN then representationalForm is represented as "Full Form" Otherwise the representationalForm is the same as the TTY source (i.e. if TTY is PT then representationalForm is PT.) PT is one of the preferred presentations.
				concept.conceptProperty.propertyQualifier.propertyQualifierId	hard coded as "HCD"
MRHIER.RRF	HCD	Source asserted hierarchical number or code for this atom in this context		concept.conceptProperty.propertyQualifier.content	This propertyQualifier is present when the HCD is populated in the the MRHIER file. The corresponding code and property for concept or code is qualified as a code or concept with a context derived heirarchy.

Relations

UMLS Mapping					
RRF File Name	RRF Column Name	RRF Definition	NCI Meta only	LexGrid Model Element	comments
Relations					
MRREL.RRF	CUI1	Unique identifier for first concept			
MRREL.RRF	AUI1	Unique identifier for first atom			
MRCONSO.RRF	CODE	Unique Identifier or code for string in source		ConceptReference.conceptCode (Model element is a ResolvedConceptReference with the value sourceOf attached to the appropriate AssociationList containing this particular REL or RELA association name.)	Mapping to the CODE depends upon the CUI or a combination of CUI and AUI values. If the CODE value is "NOCODE" then LexBIG concatenates "NOCODE" with a "-" and the CUI value. Target or source code value requires use of the DIR flag which indicates the directionality of the relationship in REL or RELA. CUI1 can be used as a pointer to the source CODE value if DIR equals Y, else CUI1 is the targetCode. Similarly, if an AUI exists AUI1 can be an indicator for CODE value to be either or source or target depending on the DIR flag.
MRREL.RRF	CUI2	Unique identifier for second concept			
MRREL.RRF	AUI2	Unique identifier for second atom			
MRCONSO.RRF	CODE	Unique Identifier or code for string in source		ConceptReference.conceptCode (Model element is a ResolvedConceptReference with the value targetOf attached to the appropriate AssociationList containing this particular REL or RELA association name.)	Mapping to the CODE depends upon the CUI or a combination of CUI and AUI values. If the CODE value is "NOCODE" then LexBIG concatenates "NOCODE" with a "-" and the CUI value. Target or source code value requires use of the DIR flag which indicates the directionality of the relationship in REL or RELA. CUI2 can be used as a pointer to the source CODE value if DIR equals Y, else CUI1 is the targetCode. Similarly, if an AUI exists AUI2 can be an indicator for CODE value to be either or source or target depending on the DIR flag.
MRREL.RRF	DIR	Source asserted directionality flag			The UMLS directional flag. Y indicates that this is the direction of the RELA relationship in its source; N indicates that it is not; otherwise indicates that it is not important or has not yet been determined. (If blank RELA, we interpret as 'N', based on empirical review of meta files).
MRREL.RRF	RELA	Relationship attribute		association.id (id inherited from Entity)	Source defined associations. If RELA value is "inverse_isa" then it is changed to "hasSubtype." All others mapped as defined in source.
MRREL.RRF	REL	Relationship		association.id (id inherited from Entity)	UMLS defined associations
		Metathesaurus			Presence of RUI in MRSAT.RRF METAUI column indicates the association defined in MRREL has an

MRSAT.RRF	METAUI	asserted unique identifier			association qualifier. Currently only MedDRA uses these.
MRSAT.RRF	ATN			AssociatedConcept.nameAndValueList.name	
MRSAT.RRF	ATV			AssociationQualification.nameAndValueList.content	
				AssociatedConcept.nameAndValueList.name	qualifier name is hard coded to "HCD" This association qualifier is attached to an association when the HCD field in MRHIER.RRF is populated. Associations are identified by evaluating a structured series of AUI's that describe the path to root (PTR field in MRHIER) Once these associations are identified they have and association qualifier attached to them with the value of the HCD loaded as the qualifier.
MRHIER.RRF	HCD			AssociationQualification.nameAndValueList.content	
MRSAB.RRF	SSN	Source short name		association.codingSchemeId (Inherited from Entity)	
MRREL.RR	REL or RELA	Relationship or Relationship attribute		association.forwardName	unqualified REL or RELA value (inverse_isa remains the same)
MRDOC.RRF	EXPL	Detailed explanation		association.reverseName	Where DOCKEY in MRDOC equals REL or RELA and value is the association name and TYPE is REL or RELA name prepended to "_inverse".
				association.inverse	Hard coded as a blank string.
				association.isAntiReflexive	hard coded to null.
				association.isAntiSymmetric	hard coded to null.
				association.isAntiTransitive	hard coded to null.
				association.isAntiTransitive	hard coded to null.
				association.isNavigable	hard coded as Boolean with value true.
				association.isReflexive	hard coded to null.
				association.isReverseFunctional	hard coded to null.
				association.isSymmetric	hard coded to null.
MRREL.RRF	SAB, REL, RELA	Source abbreviation		association.isTransitive	True when the name of the association can be mapped to a source defined in the SAB attribute of MRREL.RRF. Not the SAB value itself, but extrapolated from it using SAB to REL, RELA relationship.
				association.isTranslationAssociation	hard coded to null.
				association.targetCodingScheme	hard coded to null.
				association.entityDescription.content (inheritance path for entityDescription is Entity->versionableAndDescribable)	Hard coded to: "UMLS-defined relationships"
				relations.dc	If REL, this is hard coded as "UMLS-Relations" if RELA then it is hard coded to "Relations"
MRREL.RRF	REL, RELA		x	propertyLink.link	This is a link established when the MRREL.RRF file contains a relationship where the CUI is related to itself. Under these conditions the relationship is mapped as a property link with the MRREL defined relationship mapped as the link value.
			x	propertyLink.sourceProperty	Generated as a propertyId for concept, ex: "T-10" This is retrieved based on the AUI value in MRCONSO.RRF from the entityPropertyMultiAttrib table where the AUI equals the attributeValue column.
			x	propertyLink.targetProperty	Generated as a propertyId for concept, ex: "T-10" This is retrieved based on the AUI value in MRCONSO.RRF from the entityPropertyMultiAttrib table where the AUI equals the attributeValue column.

Document Header	format-version		Not mapped.
Document			Creates a codingSchemeVersion and SystemRelease record. If not

Header	data-version	CodingScheme.representsVersion	specified, then hard coded "UNASSIGNED"
Document Header	version	CodingScheme.representsVersion	Deprecated - use data-version if present.
Document Header	date		Not mapped.
Document Header	saved-by		Ignored but included if contained in the remark entity.
Document Header	auto-generated-by		Ignored but included if contained in the remark entity.
Document Header	subsetdef		Not mapped.
Document Header	import		Deprecated - Imports are used to assemble a larger document from smaller.
Document Header	typeref		Deprecated.
Document Header	synonymtypedef		Not mapped.
Document Header	idspace		Not mapped.The idspace is a triple - localName, URN and description.
Document Header	default-relationship-id-prefix		Not mapped.
Document Header	id-mapping	CodingScheme.supportedAssociation	This is more generalized than the LexGrid model, as it supports mapping between *any* id's. Note that its primary purpose, however, is to handle supportedAssociation.
Document Header	remark	CodingScheme.entityDescription	Will combine multiple remark entities into the entityDescription.
Document Header	default-namespace	codingScheme.codingScheme	Will use default-namespace if provided; otherwise will use filename without the extension.
Document Header	default-namespace	codingScheme.formalName	Will use default-namespace if provided; otherwise will use filename without the extension.
Document Header	default-namespace	codingScheme.registeredName	Combination of "urn:lsid:bioontology.org;" and if provided, the value in "default-namespace"; but if not will use filename without the extension.
		codingScheme.defaultLanguage	Hardcoded "en"
		codingScheme.isNative	Hardcoded "true"
Stanza	id	CodedEntry.conceptCode	
Stanza	name	CodedEntry.entityDescription	
		CodedEntry.presentation['textualPresentation'].text	
		CodedEntry.presentation['textualPresentation'].isPreferred = true	
Stanza	alt_id	CodedEntry.property.property="alt_id"	
		CodedEntry.property['alt_id'].propertyId	
		CodedEntry.property['alt_id'].text	
Stanza	is_anonymous	CodedEntry.isAnonymous = true	
Stanza	is_obsolete	CodedEntry.isActive = false	
Stanza	def	CodedEntry.definition	
		CodedEntry.definition.isPreferred = true	
Stanza	def.dbxref		See dbxref
Stanza	comment	CodedEntry.comment.text	
Stanza	subset	property[subset tag]	See subsetdef
Stanza	synonym	presentation['textualPresentation'].text	
Stanza	synonym.scope	presentation['textualPresentation'].degreeOfFidelity	
Stanza	synonym.type	presentation['textualPresentation'].representationalForm	
Stanza	synonym.dbxref	(see dbxref)	
Stanza	exact_synonym		See synonym
Stanza	narrow_synonym		See synonym
Stanza	broad_synonym		See synonym
Stanza	xref	associations.[mapsTo]	
Stanza	xref_analog		See synonym
Stanza	xref_unk		
Stanza	is_a	associations.[hasSubtype]	Reverse of the source and target.
Stanza	is_a.namespace		If present, the supplied namespace becomes the owning "codingScheme".
Stanza	is_a.derived	associations.hasSubtype.associationQualifier	If present, need to include derived in the supportedAssociationQualifiers section
Stanza	intersection_of		Processed the same way that OWL intersection operator is processed. This includes creation of anonymous sets.
Stanza	union_of		Same as OWL
Stanza	disjoint_from		Same as OWL
Stanza	relationship	associations.	

Stanza	relationship.not_necessary	associations..associationQualifier	
Stanza	relationship.inverse_necessary	associations..associationQualifier	
Stanza	relationship.namespace		If present, the supplied namespace becomes the owning "codingScheme".
Stanza	relationship.derived	associations..associationQualifier	
Stanza	relationship.cardinality	associations..associationQualifier	
Stanza	relationship.maxCardinality	associations..associationQualifier	
Stanza	relationship.minCardinality	associations..associationQualifier	
Stanza	is_obsolete	codedEntry.isActive = false	
		codedEntry.conceptStatus="is_obsolete"	
Stanza	replaced_by		
Stanza	consider		Not Mapped
Stanza	use_term		(deprecated)
dbxref	dbxref name	CodedEntry..source	
		supportedSource	dbxref name format is inconsistent. In most cases, it can be the localName of supportedSource, but special processing may be necessary in the case of URL's, etc
dbxref	dbxref description		Not mapped.
dbxref	trailing modifiers		Not mapped.
