Known Issues

The templates do not import correctly so there will be some broken (red) links on the concept pages.

Installation Process

The installation will take place in four separate steps.

1. Use a bat file to extract the metadata about the concepts and write them as files into a directory.
2. Run a php file to read the files and publish them to the Wiki.
3. Edit the Main page to show the ontology hierarchy
4. Import the templates into the Wiki

Setup and configuration

1. Download and unzip the [LexWikiPublisher 1.0 zip file](#).
2. Open the lexWikiPublisher.prop file and enter the configuration information

The following are the configuration variables along with an example for each.

Required configuration information

logfile - location to store the published concepts
C:/Temp/publishbatch-local

configpath - the path to the configuration file in the LexEVS installation
X:\services\lexevs\resources\config
lbconfig.props

csn -the code system name to be published
NPO

ccd - the concept code at the root of the hierarchy
Entity

wiki - the name of the wiki
LexWiki test

template - SMW template name
LexWiki

formname - the name of the semantic mediawiki form
LexWiki_NPO_Form

Optional configuration information

republishexistingpages - Republish existing pages?
yes

propertiesonly - If you want to get properties and associations published only
no

vsformname - the name of the semantic mediawiki form for value sets

user - Wiki user name
Wiki user name

pwd - Wiki user password
Wiki user password

self - is the selected node to be published?
yes

batch - will all the children of the selected node be published?
yes

server - the server where the wiki is located
informatics.mayo.edu

port - the port number where the wiki is setup
8080

batchsize - number of concepts to process in each batch
50

namespace - the over riding namespace to use for pages
LexWiki master

startPage - the starting page where index.php is the default index.php

Extracting concepts from LexEVS

1. Be sure the directory configured for the logfile variable exists and is write enabled.
2. Run the `lexWikiPublisher` file using the bat file or shell script.

Publishing to the Wiki

1. Open a command prompt in the lexwiki's maintenance directory
2. Run the publish.php using the directory location of the files created during the lexEVS as the only argument
`php publish.php /home/myhomedir/tobepublishedpages`

Displaying the category tree

1. Log in to the Wiki and display the Main Page.
2. Click on the Edit tab at the top of the page.
3. Update the information between the categorytree tags to match your ontology information
Category BGT Gene Kind(B179) not found
 BGT - the coding scheme name
 Gene Kind - the root node for the Ontology
(B179) - short name for the root node
Category NPO_Entity(Entity) not found

Importing the templates

1. From the wiki, select SpecialPages.
2. On the SpecialPages, select import file.
3. Import the templates which correspond to the ontology you created.
