Supplement142 Meeting Notes 2009-02-13

Attendees: Jay Gaeta, Carl Jaffe, John Perry, Justin Kirby, John Freymann, Brian Hughes

1. Justin will continue to work through the table in supplement 142 to build a da.script that conforms as closely as possible to the "Basic Profile" outlined by working group 18
   a. Justin will post updates on our wiki site for anyone interested in seeing what the current status is.
   b. Upon completion Justin will setup another meeting to discuss questions and tags that are problematic for CTP
2. JP will begin development efforts on CTP to prepare for integrating profiles when the scripts are completed. This will include
   a. Adding the ability to choose a pre-defined de-identification profile based on one of the supplement 142 profiles
   b. Adding the ability to tweak these profiles and save them as a user-defined profile for later use
   c. Potentially adding an **increment time** function, but we might just assume that when times are needed the user should employ a different profile that leaves them intact. (Increment time may be a requirement of Supplement142 in some cases)
3. Jay agreed to let Justin contact him with questions regarding implementation of the supplement rules
4. JP will investigate additional new development suggestions
   a. Adding a feature to allow storage of all dicom tags into a client-side database so they can be easily used to update/append to the de-identified data if it is found that this information is needed after the original submission
   b. Creating an "explorer" type of view for the pipeline configuration page (to help accommodate CTP's using a large number of pipelines)
