

Using the JIRA Shortcut

On a wiki page, to add a link that points to a single JIRA issue, you have the following options:

Create a link using markup

Enter a shortcut in the wiki markup, for example:

```
[TIGER-1@JIRA]
```

where TIGER is the key (frequently your project name with no spaces) and 1 is the issue number and @JIRA is the shortcut for the part of the URL that is common for all issues in a particular JIRA project.

The following, inserted in wiki markup

```
[TEST-3@JIRA]
```

produces this link: [TEST-3@JIRA](#). Click the link to see the page for the TEST-3 issue in the [Demo Project \(TEST\) JIRA project](#).

Create a link by pasting

1. In Jira, copy the URL for the issue.
2. In your wiki page, paste the URL. Confluence automatically converts it to a link and then to a Jira macro.
3. Press Ctrl+Z or click the Undo icon in the toolbar. The URL is now a link.
4. Consider deleting the following string from the link text, leaving behind only the issue ID.

```
https://tracker.nci.nih.gov/browse/
```

Here is an example link produced with this pasting method: [TEST-3](#)
