

Copying the Globus Shared Endpoint UUID

DME requires the UUID of your Globus shared endpoint in the following scenarios:

- If you use the GUI to download data from DME to a Globus endpoint and you choose to specify your endpoint manually
- If you use the CLU to download data from DME to a Globus endpoint or to register data from that endpoint into DME

Each time you need the UUID, perform the following steps:

1. Prepare to use Globus, as described in [Preparing to Use Globus](#).
2. In Globus, navigate to the list of endpoints that are sharable by you. The shared endpoint you created is available in that list with the following description:
Shared Endpoint on <name of shareable Globus endpoint>
3. Click the shared endpoint link. A page appears with details about that endpoint.
4. Next to the **Endpoint UUID** field, click the copy icon.
