

calnt 0003 - Where caArray data is stored, when a calIntegrator study is mapped to a caArray experiment

Question: Where is caArray data stored, when a calIntegrator study is mapped to a caArray experiment?

Topic: calIntegrator-caArray Integration

Release: Not specified

Date entered: Not specified

Details About the Question

My calIntegrator study was mapped to a caArray experiment. Where was the caArray data stored? In caArray, or calIntegrator?

Answer

If you mapped your calIntegrator study to an experiment in caArray, after you deployed that study, the derived microarray data (also known as level-2 data) would be retrieved from caArray and stored in calIntegrator. As a result, if the experiment was updated in caArray, your query in calIntegrator will not get the updated caArray data. You will need to remap and redeploy the study to get the updated caArray data.
