

Getting Started with DME CLU

If you decide to use the CLU to perform various activities in DME, the following steps are pre-requisites:

1. If you are using Windows, install Cygwin as described in the following site: <https://www.cygwin.com/>

For best results, run Cygwin.bat from C:\cygwin64\ rather than from the Windows Start menu.

2. Check which version of Java is currently installed:

```
java -version
```

The command output should display the version of Java. DME requires Java 1.8.x.

3. If Java 1.8.x is not installed, perform the following steps:
 - a. Download Java 1.8.x from the following page: <https://www.java.com/en/download/>
 - b. Install Java, as described in the following installation instructions: https://www.java.com/en/download/help/index_installing.xml
 - c. Update your PATH system variable with the Java executable folder (such as c:\jdk1.8_13\bin). For details, refer to the following instructions: <https://java.com/en/download/help/path.xml>
 - d. Check whether you have performed the previous steps correctly by repeating the java -version command.
4. If the latest version of JDK is not installed, perform the following steps:
 - a. Download JDK from the following page: <https://www.oracle.com/technetwork/java/javase/downloads/jdk8-downloads-2133151.html>
 - b. Install JDK. For information, refer to the following page: <https://www.oracle.com/technetwork/java/javase/documentation/index.html>
5. In a cmd or shell window, type the following command in your working directory to clone DME utilities to your local machine:

```
Git clone https://github.com/CBIIT/HPC_DME_APIs
```

The system creates a subdirectory (HPC_DME_APIs) containing all files from that GitHub repository.

6. In the HPC_DME_APIs/utills/ folder, create a copy of the sample configuration file (hpcdme.properties-sample) and rename it (as hpcdme.properties). Edit your hpcdme.properties file to make the following configuration changes:

Property	Instructions
Server settings	If you want to connect to the UAT tier, uncomment the UAT server settings and comment out the Production server settings. By default, the Production server settings are enabled.
hpc.ssl.keystore.password	Contact NCIDDataVault@mail.nih.gov to request this password.
hpc.user	Specify your NIH user ID.
hpc.default.globus.endpoint	If you intend to transfer files using Globus, specify the UUID of the Globus endpoint that you want to use. (The following instructions may be helpful: Copying the Globus Shared Endpoint UUID .)
hpc.server.proxy.port	<div>If you intend to use Biowulf, specify the proxy port. To determine the correct port, run the following echo command:</div> <pre>echo \$http_proxy</pre> <div>The output includes the port. For example, if the output of the echo command is http://dtn08-e0:3128, then your port is 3128.</div>
hpc.server.proxy.url	<div>If you intend to use Biowulf, specify the proxy URL. To determine the correct URL, ping the output of the echo command. For example:</div> <pre>ping dtn08-e0</pre> <div>The output includes an IP address. Specify that IP address as the URL.</div>
hpc.error-log.dir hpc.log.file	<div>If you are using Windows, consider specifying a non-default location for the error log file. For example:</div> <pre>hpc.error-log.dir=log hpc.log.file=log/hpc-cli.log</pre>

7. Configure environment variables:

- a. Navigate to your ~/.bashrc or ~/.profile file, where ~ represents your home directory. For example:

```
C:\cygwin64\home\<username>
```

- b. If you are running CLU from Biowulf or Helix, add the following command to your `~/.bashrc` or `~/.profile` file:

```
module load java/11.0.21
```

- c. Edit your `~/.bashrc` or `~/.profile` file to append the following commands, where `<client_utils_home>` is the absolute path to the `HPC_DME_APIs\utils\` folder. The following commands define the `HPC_DM_UTILS` environment variable and update the `PATH` environment variable to include the path to the scripts folder:

```
export HPC_DM_UTILS="<client_utils_home>"
export PATH=$HPC_DM_UTILS/scripts/:$PATH
```

8. If you are using Cygwin on Windows, run the following commands in Cygwin to change end-of-line delimiters from Windows standard to Unix standard in any files involved in CLU setup:

- a. Adjust the line delimiters in the file with your export commands (`~/.bashrc` or `~/.profile`). For example:

```
sed -i "s/\r$//" ~/.bashrc
```

- b. Adjust the line delimiters in all files in the scripts folder. Use the following command:

```
sed -i "s/\r$//" $HPC_DM_UTILS/scripts/*
```

9. To make the above changes take effect in current Bash session, source the modified file (`~/.bashrc` or `~/.profile`). For example:

```
source ~/.bashrc
```

10. Generate a DME API authentication token, as described in [Generating a DME API Authentication Token via the CLU](#).

11. If you want to use Globus or AWS S3, follow the instructions in the following pages:

- [Preparing to Use Globus](#)
- [Preparing to Use AWS S3 Bucket for the CLU](#)

To view a list of DME CLU commands, type `dm_list_commands` . To view usage information for any DME CLU command, type the command with the help (-h) parameter. For detailed information on each of the available DME CLU commands, refer to the following pages:

- Getting Started
 - [Generating a DME API Authentication Token via the CLU](#) — `dm_generate_token`
 - [DME CLU Quick Reference](#) - (most frequently-used commands)
- Finding Data
 - [Searching for Data via the CLU](#) — `dm_query_dataobject`
- Using Bookmarks
 - [Adding a Bookmark via the CLU](#) — `dm_add_bookmark`

 - [Using dm_download_collection](#) — `dm_download_collection`
 - [Using dm_download_collection_globus](#) — `dm_download_collection_globus`
 - [Using dm_download_collection_s3](#) — `dm_download_collection_s3`
 - [Using dm_download_collection_aspera](#) — `dm_download_collection_aspera`
- Using DME as an Administrator
 - [Registering a User via the CLU](#) — `dm_register_user`
 - [Adding a Bookmark and Permissions via the CLU](#) — `dm_add_bookmark`
 - [Updating a Bookmark and Permissions via the CLU](#) — `dm_update_bookmark`
 - [Moving or Renaming a Collection or File via the CLU](#) — `dm_rename`
 - [Deleting Data via the CLU](#) — `dm_delete_datafile`, `dm_delete_collection`

Important Note for Mac Version 10.12.4/10.12.6

If you want to use DME CLU on a Mac (version 10.12.4/10.12.6) and the version of curl on your machine is OpenSSL 0.9.8zh 14 Jan 2016, perform the following steps to rebuild curl.

1. From a terminal prompt, execute the following command:

```
/usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"
```

This command downloads and installs Homebrew, a package manager to download, build, and install Mac software.

2. Follow the prompts. The system might request your username/password multiple times.
3. Execute the following command:

```
brew install curl --with-openssl
```

This command invokes Homebrew to build and install curl in /usr/local/opt with the latest version of openssl. At the end of the installation, a message appears indicating that this is keg-only. It provides the command to update the PATH so that the system uses your new curl installation, rather than the Mac-supplied one.

4. Execute the command as provided at the end of curl installation, which should be the following command:

```
export PATH="/usr/local/opt/curl/bin:$PATH" >> ~/.bash_profile
```

5. Confirm the installation: Open a new terminal and check the version of curl with the following command:

```
curl --version
```

The following information should appear:

```
curl 7.58.0 (x86_64-apple-darwin16.7.0) libcurl/7.58.0 OpenSSL/1.0.2n zlib/1.2.8
Release-Date: <today's date or the date you install your new curl>
Protocols: dict file ftp ftps gopher http https imap imaps ldap ldaps pop3 pop3s rtsp smb smbs smtp
smtps telnet tftp
Features: AsynchDNS IPv6 Largefile NTLM NTLM_WB SSL libz TLS-SRP UnixSockets HTTPS-proxy
```
