Known Issues

The templates do not import correctly so there will be some broken (red) links on the concept pages.

Installation Process

The installation will take place in four separate steps.

1. Use a bat file to extract the metadata about the concepts and write them as files into a directory.
2. Run a php file to read the files and publish them to the Wiki.
3. Edit the Main page to show the ontology hierarchy
4. Import the templates into the Wiki

Setup and configuration

1. Download and unzip the [LexWikiPublisher 1.0 zip file](#).
2. Open the lexWikiPublisher.prop file and enter the configuration information

The following are the configuration variables along with an example for each.

Required configuration information

logfile - location to store the published concepts
C:/Temp/publishbatch-local

configpath - the path to the configuration file in the LexEVS installation
X:\\services\\lexevs\\resources\\config
lbconfig.props

csn -the code system name to be published
NPO

ccd - the concept code at the root of the hierarchy
Entity

wiki - the name of the wiki
LexWiki test

template - SMW template name
LexWiki

formname - the name of the semantic mediawiki form
LexWiki_NPO_Form
